

Package ‘dimensio’

July 30, 2024

Title Multivariate Data Analysis

Version 0.8.1

Maintainer Nicolas Frerebeau <nicolas.frerebeau@u-bordeaux-montaigne.fr>

Description Simple Principal Components Analysis (PCA) and (Multiple) Correspondence Analysis (CA) based on the Singular Value Decomposition (SVD). This package provides S4 classes and methods to compute, extract, summarize and visualize results of multivariate data analysis. It also includes methods for partial bootstrap validation described in Greenacre (1984, ISBN: 978-0-12-299050-2) and Lebart et al. (2006, ISBN: 978-2-10-049616-7).

|--------|---------------|
| biplot | <i>Biplot</i> |
|--------|---------------|

Description

Biplot

Usage

```
## S4 method for signature 'CA'
biplot(
  x,
  ...,
  axes = c(1, 2),
  type = c("symetric", "rows", "columns", "contributions"),
  active = TRUE,
  sup = TRUE,
  labels = NULL,
  col.rows = c("#E69F00", "#009E73"),
  col.columns = c("#56B4E9", "#F0E442"),
  cex.rows = graphics::par("cex"),
  cex.columns = graphics::par("cex"),
  pch.rows = 16,
```

```

    pch.columns = 17,
    xlim = NULL,
    ylim = NULL,
    main = NULL,
    sub = NULL,
    legend = list(x = "topleft")
)

## S4 method for signature 'PCA'
biplot(
  x,
  ...,
  axes = c(1, 2),
  type = c("form", "covariance"),
  active = TRUE,
  sup = TRUE,
  labels = "variables",
  col.rows = c("#E69F00", "#009E73"),
  col.columns = c("#56B4E9", "#F0E442"),
  xlim = NULL,
  ylim = NULL,
  main = NULL,
  sub = NULL,
  legend = list(x = "topleft")
)

```

Arguments

| | |
|-------------|---|
| x | A CA , MCA or PCA object. |
| ... | Currently not used. |
| axes | A length-two numeric vector giving the dimensions to be plotted. |
| type | A character string specifying the biplot to be plotted (see below). It must be one of "rows", "columns", "contribution" (CA), "form" or "covariance" (PCA). Any unambiguous substring can be given. |
| active | A logical scalar: should the active observations be plotted? |
| sup | A logical scalar: should the supplementary observations be plotted? |
| labels | A character vector specifying whether "rows"/"individuals" and/or "columns"/"variables" names must be drawn. Any unambiguous substring can be given. |
| col.rows | A length-two vector of color specification for the active and supplementary rows. |
| col.columns | A length-two vector of color specification for the active and supplementary columns. |
| xlim | A length-two numeric vector giving the x limits of the plot. The default value, NULL, indicates that the range of the finite values to be plotted should be used. |
| ylim | A length-two numeric vector giving the y limits of the plot. The default value, NULL, indicates that the range of the finite values to be plotted should be used. |

| | |
|----------------------------|---|
| main | A character string giving a main title for the plot. |
| sub | A character string giving a subtitle for the plot. |
| legend | A list of additional arguments to be passed to <code>graphics::legend()</code> ; names of the list are used as argument names. If NULL, no legend is displayed. |
| pch, pch.rows, pch.columns | A symbol specification. |
| cex, cex.rows, cex.columns | A numeric vector giving the amount by which plotting characters and symbols should be scaled relative to the default. |

Details

A biplot is the simultaneous representation of rows and columns of a rectangular dataset. It is the generalization of a scatterplot to the case of multivariate data: it allows to visualize as much information as possible in a single graph (Greenacre 2010).

Biplots have the drawbacks of their advantages: they can quickly become difficult to read as they display a lot of information at once. It may then be preferable to visualize the results for individuals and variables separately.

Value

`biplot()` is called for its side-effects: it results in a graphic being displayed. Invisibly returns `x`.

PCA Biplots

`form` (**row-metric-preserving**) The form biplot favors the representation of the individuals: the distance between the individuals approximates the Euclidean distance between rows. In the form biplot the length of a vector approximates the quality of the representation of the variable.

`covariance` (**column-metric-preserving**) The covariance biplot favors the representation of the variables: the length of a vector approximates the standard deviation of the variable and the cosine of the angle formed by two vectors approximates the correlation between the two variables. In the covariance biplot the distance between the individuals approximates the Mahalanobis distance between rows.

CA Biplots

`symetric` (**symetric biplot**) Represents the row and column profiles simultaneously in a common space: rows and columns are in standard coordinates. Note that the the inter-distance between any row and column items is not meaningful.

`rows` (**asymmetric biplot**) Row principal biplot (row-metric-preserving) with rows in principal coordinates and columns in standard coordinates.

`columns` (**asymmetric biplot**) Column principal biplot (column-metric-preserving) with rows in standard coordinates and columns in principal coordinates.

`contribution` (**asymmetric biplot**) Contribution biplot with rows in principal coordinates and columns in standard coordinates multiplied by the square roots of their masses.

Examples

```
## Replicate examples from Greenacre 2007, p. 59-68
data("countries")

## Compute principal components analysis
## All rows and all columns obtain the same weight
row_w <- rep(1 / nrow(countries), nrow(countries)) # 1/13
col_w <- rep(1 / ncol(countries), ncol(countries)) # 1/6
Y <- pca(countries, scale = FALSE, weight_row = row_w, weight_col = col_w)

## Row-metric-preserving biplot (form biplot)
biplot(Y, type = "form")

## Column-metric-preserving biplot (covariance biplot)
biplot(Y, type = "covariance", legend = list(x = "bottomright"))

## Replicate examples from Greenacre 2007, p. 79-88
data("benthos")

## Compute correspondence analysis
X <- ca(benthos)

## Symetric CA biplot
biplot(X, labels = "columns", legend = list(x = "bottomright"))

## Row principal CA biplot
biplot(X, type = "row", labels = "columns", legend = list(x = "bottomright"))

## Column principal CA biplot
biplot(X, type = "column", labels = "columns", legend = list(x = "bottomright"))

## Contribution CA biplot
biplot(X, type = "contrib", labels = NULL, legend = list(x = "bottomright"))
```

boot *Partial Bootstrap Analysis*

Description

Checks analysis with partial bootstrap resampling.

Usage

```
## S4 method for signature 'CA'  
bootstrap(object, n = 30)  
  
## S4 method for signature 'PCA'  
bootstrap(object, n = 30)
```

Arguments

object A [CA](#) or [PCA](#) object.
n A non-negative [integer](#) giving the number of bootstrap replications.

Value

Returns a [BootstrapCA](#) or a [BootstrapPCA](#) object.

Examples

```
## Bootstrap on CA  
## Data from Lebart et al. 2006, p. 170-172  
data("colours")  
  
## Compute correspondence analysis  
X <- ca(colours)
```

```
## Bootstrap (30 replicates)
Y <- bootstrap(X, n = 30)

## Not run:
## Get replicated coordinates
get_replications(Y, margin = 1)
get_replications(Y, margin = 2)

## End(Not run)

## Plot with ellipses
viz_rows(Y)
viz_tolerance(Y, margin = 1, level = c(0.68, 0.95))

viz_columns(Y)
viz_tolerance(Y, margin = 2, level = c(0.68, 0.95))

## Plot with convex hulls
viz_columns(Y)
viz_hull(Y, margin = 2)

## Bootstrap on PCA
## Compute principal components analysis
data("iris")
X <- pca(iris)

## Bootstrap (30 replicates)
Y <- bootstrap(X, n = 30)

## Plot with ellipses
viz_variables(Y)
viz_tolerance(Y, margin = 2, level = c(0.68, 0.95))
```

burt

Burt Table

Description

Computes the burt table of a factor table.

Usage

```
burt(object, ...)
```

```
## S4 method for signature 'data.frame'
burt(object, exclude = NULL, abbrev = TRUE)
```

Arguments

| | |
|---------|---|
| object | A data.frame . |
| ... | Currently not used. |
| exclude | A vector of values to be excluded when forming the set of levels (see factor()). If NULL (the default), will make NA an extra level. |
| abbrev | A logical scalar: should the column names be abbreviated? If FALSE, these are of the form 'factor_level' but if abbrev = TRUE they are just 'level' which will suffice if the factors have distinct levels. |

Value

A symmetric [matrix](#).

Author(s)

N. Frerebeau

Other tools: [cdt\(\)](#)

Examples

```
## Create a factor table
x <- data.frame(
  A = c("a", "b", "a"),
  B = c("x", "y", "z")
)

## Complete disjunctive table
cdt(x)

## Burt table
burt(x)
```

Description

Computes a simple correspondence analysis based on the singular value decomposition.

Usage

```
ca(object, ...)  
  
## S4 method for signature 'data.frame'  
ca(object, rank = NULL, sup_row = NULL, sup_col = NULL)  
  
## S4 method for signature 'matrix'  
ca(object, rank = NULL, sup_row = NULL, sup_col = NULL)
```

Arguments

| | |
|---------|--|
| object | A $m \times p$ numeric matrix or a data.frame . |
| ... | Currently not used. |
| rank | An integer value specifying the maximal number of components to be kept in the results. If NULL (the default), $\min(m, p) - 1$ components will be returned. |
| sup_row | A vector specifying the indices of the supplementary rows. |
| sup_col | A vector specifying the indices of the supplementary columns. |

Value

A [CA](#) object.

head(get_coordinates(X, margin = 2))

## Get row distances to centroid
head(get_distances(X, margin = 1))

## Get row inertias
head(get_inertia(X, margin = 1))

## Get row contributions
head(get_contributions(X, margin = 1))

## Get eigenvalues
get_eigenvalues(X)

```

cdt

Complete Disjunctive Table

Description

Computes the complete disjunctive table of a factor table.

Usage

```

cdt(object, ...)

## S4 method for signature 'matrix'
cdt(object, exclude = NULL, abbrev = TRUE)

## S4 method for signature 'data.frame'
cdt(object, exclude = NULL, abbrev = TRUE)

```

Arguments

| | |
|--------|--------------------------------|
| object | A data.frame . |
| ... | Currently not used. |

- `exclude` A vector of values to be excluded when forming the set of levels (see `factor()`). If NULL (the default), will make NA an extra level.
- `abbrev` A `logical` scalar: should the column names be abbreviated? If FALSE, these are of the form 'factor_level' but if `abbrev = TRUE` they are just 'level' which will suffice if the factors have distinct levels.

Value

A `data.frame`.

Author(s)

N. Frerebeau

)

## Complete disjunctive table
cdt(x)

## Burt table
burt(x)
```

colours

Colours

Description

Contingency table of eye and hair colours of different individuals.

Usage

colours

Format

A `data.frame` with 4 columns (hair colours) and 4 rows (eye colours).

Source

Lebart, L., Piron, M. and Morineau, A. *Statistique exploratoire multidimensionnelle: visualisation et inférence en fouille de données*. Paris: Dunod, 2006, p. 170-172

See Also

Other datasets: [benthos](#), [countries](#)

countries

Countries

Description

Student ratings of 13 countries on six attributes.

Usage

countries

Format

A [data.frame](#) with 6 columns (attributes) and 13 rows (countries).

Source

Greenacre, M. J. *Biplots in Practice*. Bilbao: Fundación BBVA, 2010.

See Also

Other datasets: [benthos](#), [colours](#)

dimnames

Dimnames of an Object

Description

Retrieve or set the dimnames of an object.

Usage

```
## S4 method for signature 'MultivariateAnalysis'  
dim(x)  
  
## S4 method for signature 'MultivariateAnalysis'  
rownames(x, do.NULL = TRUE, prefix = "row")  
  
## S4 method for signature 'MultivariateAnalysis'  
colnames(x, do.NULL = TRUE, prefix = "col")  
  
## S4 method for signature 'MultivariateAnalysis'  
dimnames(x)
```

Arguments

x An object from which to retrieve the row or column names (a [CA](#) or [PCA](#) object).
do.NULL A [logical](#) scalar. If FALSE and names are NULL, names are created.
prefix A [character](#) string specifying the prefix for created names.

Author(s)

N. Frerebeau

See Also

Other mutators: [get_contributions\(\)](#), [get_coordinates\(\)](#), [get_data\(\)](#), [get_distances\(\)](#), [get_eigenvalues\(\)](#), [loadings\(\)](#), [subset\(\)](#)

get_contributions *Get Contributions*

Description

Get Contributions

Usage

```
get_contributions(x, ...)  
  
get_correlations(x, ...)  
  
get_cos2(x, ...)  
  
## S4 method for signature 'MultivariateAnalysis'  
get_contributions(x, margin = 1)
```

```
## S4 method for signature 'PCA'
get_correlations(x, sup_name = ".sup")

## S4 method for signature 'MultivariateAnalysis'
get_cos2(x, margin = 1, sup_name = ".sup")
```

Arguments

| | |
|----------|--|
| x | An object from which to get element(s) (a CA , MCA or PCA object). |
| ... | Currently not used. |
| margin | A length-one numeric vector giving the subscript which the data will be returned: 1 indicates individuals/rows (the default), 2 indicates variables/columns. |
| sup_name | A character string specifying the name of the column to create for supplementary points attribution (see below). |

Value

- `get_contributions()` returns a [data.frame](#) of contributions to the definition of the principal dimensions.
- `get_correlations()` returns a [data.frame](#) of correlations between variables and dimensions (PCA). An extra column (named after `sup_name`) is added specifying whether an observation is a supplementary point or not.
- `get_cos2()` returns a [data.frame](#) of \cos^2 values (i.e. quality of the representation of the points on the factor map). An extra column (named after `sup_name`) is added specifying whether an observation is a supplementary point or not.

get_coordinates

Get Coordinates

Description

Get Coordinates

Usage

```

get_coordinates(x, ...)

get_replications(x, ...)

## S4 method for signature 'MultivariateAnalysis'
get_coordinates(x, margin = 1, principal = TRUE, sup_name = ".sup")

## S4 method for signature 'MultivariateBootstrap'
get_replications(x, margin = 1)

## S4 method for signature 'BootstrapPCA'
get_replications(x)

```

Arguments

| | |
|-----------|--|
| x | An object from which to get element(s) (a CA , MCA or PCA object). |
| ... | Currently not used. |
| margin | A length-one numeric vector giving the subscript which the data will be returned: 1 indicates individuals/rows (the default), 2 indicates variables/columns. |
| principal | A logical scalar: should principal coordinates be returned? If FALSE, standard coordinates are returned. |
| sup_name | A character string specifying the name of the column to create for supplementary points attribution (see below). |

Value

- `get_coordinates()` returns a [data.frame](#) of coordinates. An extra column (named after `sup_name`) is added specifying whether an observation is a supplementary point or not.
- `get_replications()` returns an [array](#) of coordinates.

Other mutators: [dimnames\(\)](#), [get_contributions\(\)](#), [get_coordinates\(\)](#), [get_data\(\)](#), [get_eigenvalues\(\)](#), [loadings\(\)](#), [subset\(\)](#)

| | |
|-----------------|------------------------|
| get_eigenvalues | <i>Get Eigenvalues</i> |
|-----------------|------------------------|

Description

Get Eigenvalues

Usage

```
get_eigenvalues(x)

get_inertia(x, ...)

get_variance(x, ...)

## S4 method for signature 'MultivariateAnalysis'
get_eigenvalues(x)

## S4 method for signature 'MultivariateAnalysis'
get_inertia(x, margin = 1)

## S4 method for signature 'MultivariateAnalysis'
get_variance(x, digits = 2)
```

Arguments

| | |
|--------|--|
| x | An object from which to get element(s) (a CA , MCA or PCA object). |
| ... | Currently not used. |
| margin | A length-one numeric vector giving the subscript which the data will be returned: 1 indicates individuals/rows (the default), 2 indicates variables/columns. |
| digits | An integer indicating the number of decimal places to be used. |

Value

- `get_eigenvalues()` returns a [data.frame](#) with the following columns: eigenvalues, variance (percentage of variance) and cumulative (cumulative percentage of variance).
- `get_variance()` returns a [numeric](#) vector giving the percentage of explained variance of each dimension.
- `get_inertia()` returns a [numeric](#) vector.

| | |
|----------|-------------------------|
| loadings | <i>Extract Loadings</i> |
|----------|-------------------------|

Description

Extract loadings in principal components analysis.

Usage

```
## S4 method for signature 'PCA'  
loadings(x, ...)
```

Arguments

| | |
|-----|-------------------------------|
| x | A PCA object. |
| ... | Currently not used. |

Value

Returns variable loadings (i.e. the coefficients of the linear combination of the original variables).

Note

`loadings()` is only implemented for consistency with [stats::loadings\(\)](#).

| | |
|-----|---|
| mca | <i>Multiple Correspondence Analysis</i> |
|-----|---|

Description

Computes a multiple correspondence analysis.

Usage

```
mca(object, ...)  
  
## S4 method for signature 'data.frame'  
mca(object, rank = NULL, sup_row = NULL, sup_col = NULL, sup_quanti = NULL)  
  
## S4 method for signature 'matrix'  
mca(object, rank = NULL, sup_row = NULL, sup_col = NULL)
```

Arguments

| | |
|------------|--|
| object | A $m \times p$ numeric matrix or a data.frame . |
| ... | Currently not used. |
| rank | An integer value specifying the maximal number of components to be kept in the results. If NULL (the default), $\min(m, p) - 1$ components will be returned. |
| sup_row | A vector specifying the indices of the supplementary rows. |
| sup_col | A vector specifying the indices of the supplementary categorical columns. |
| sup_quanti | A vector specifying the indices of the supplementary quantitative columns. |

Value

A [MCA](#) object.

Author(s)

N. Frerebeau

References

Lebart, L., Piron, M. and Morineau, A. *Statistique exploratoire multidimensionnelle: visualisation et inférence en fouille de données*. Paris: Dunod, 2006.

See Also

[svd\(\)](#), [cdt\(\)](#)

Other multivariate analysis: [ca\(\)](#), [pca\(\)](#), [predict\(\)](#)

Description

Computes a principal components analysis based on the singular value decomposition.

Usage

```
pca(object, ...)  
  
## S4 method for signature 'data.frame'  
pca(  
  object,  
  center = TRUE,  
  scale = TRUE,  
  rank = NULL,  
  sup_row = NULL,  
  sup_col = NULL,  
  sup_quali = NULL,  
  weight_row = NULL,  
  weight_col = NULL  
)  
  
## S4 method for signature 'matrix'  
pca(  
  object,  
  center = TRUE,  
  scale = TRUE,  
  rank = NULL,  
  sup_row = NULL,  
  sup_col = NULL,  
  weight_row = NULL,  
  weight_col = NULL  
)
```

Arguments

| | |
|---------|---|
| object | A $m \times p$ numeric matrix or a data.frame . |
| ... | Currently not used. |
| center | A logical scalar: should the variables be shifted to be zero centered? |
| scale | A logical scalar: should the variables be scaled to unit variance? |
| rank | An integer value specifying the maximal number of components to be kept in the results. If NULL (the default), $p - 1$ components will be returned. |
| sup_row | A vector specifying the indices of the supplementary rows. |

| | |
|------------|---|
| sup_col | A vector specifying the indices of the supplementary columns. |
| sup_quali | A vector specifying the indices of the supplementary qualitative columns. |
| weight_row | A numeric vector specifying the active row (individual) weights. If NULL (the default), uniform weights are used. Row weights are internally normalized to sum 1 |
| weight_col | A numeric vector specifying the active column (variable) weights. If NULL (the default), uniform weights (1) are used. |

Value

A [PCA](#) object.

Examples

```
## Load data
data("iris")

## Compute principal components analysis
X <- pca(iris, scale = TRUE, sup_row = sample(150, 10), sup_col = 2)

## Get row coordinates
head(get_coordinates(X, margin = 1))

## Get column coordinates
head(get_coordinates(X, margin = 2))

## Get correlations between variables and dimensions
head(get_correlations(X))

## Get eigenvalues
get_eigenvalues(X)
```

| | |
|---------|--------------------------------|
| predict | <i>Predict New Coordinates</i> |
|---------|--------------------------------|

Description

Predict the projection of new individuals/rows or variables/columns.

Usage

```
## S4 method for signature 'CA'  
predict(object, newdata, margin = 1)  
  
## S4 method for signature 'MCA'  
predict(object, newdata, margin = 1)  
  
## S4 method for signature 'PCA'  
predict(object, newdata, margin = 1)
```

Arguments

| | |
|---------|---|
| object | A CA or PCA object. |
| newdata | An object of supplementary points coercible to a matrix for which to compute principal coordinates. |
| margin | A length-one numeric vector giving the subscript which the data will be predicted: 1 indicates individuals/rows (the default), 2 indicates variables/columns. |

Value

A [data.frame](#) of coordinates.

Author(s)

N. Frerebeau

See Also

Other multivariate analysis: [ca\(\)](#), [mca\(\)](#), [pca\(\)](#)

Examples

```
## Create a matrix  
A <- matrix(data = sample(1:10, 100, TRUE), nrow = 10, ncol = 10)  
  
## Compute correspondence analysis  
X <- ca(A, sup_row = 8:10, sup_col = 7:10)  
  
## Predict new row coordinates  
Y <- matrix(data = sample(1:10, 120, TRUE), nrow = 20, ncol = 6)
```

```

predict(X, Y, margin = 1)

## Predict new column coordinates
Z <- matrix(data = sample(1:10, 140, TRUE), nrow = 7, ncol = 20)
predict(X, Z, margin = 2)

```

screepLOT

Scree Plot

Description

Plot eigenvalues (scree plot) or variances histogram.

Usage

```

## S4 method for signature 'MultivariateAnalysis'
screepLOT(
  x,
  ...,
  eigenvalues = FALSE,
  cumulative = FALSE,
  labels = TRUE,
  limit = 10,
  col = "grey90",
  border = "grey10",
  col.cumulative = "red",
  lty.cumulative = "solid",
  lwd.cumulative = 2
)

```

Arguments

| | |
|----------------|--|
| x | A CA , MCA or PCA object. |
| ... | Extra parameters to be passed to graphics::barplot() . |
| eigenvalues | A logical scalar: should the eigenvalues be plotted instead of variance/inertia? |
| cumulative | A logical scalar: should the cumulative percentages of variance be plotted? |
| labels | A logical scalar: should text labels be drawn on top of bars? |
| limit | An integer specifying the number of top elements to be displayed. |
| col, border | A character string specifying the bars infilling and border colors. |
| col.cumulative | A specification for the line color. |
| lty.cumulative | A specification for the line type. |
| lwd.cumulative | A specification for the line width. |

Value

screeplot() is called for its side-effects: it results in a graphic being displayed. Invisibly returns `x`.

Author(s)

N. Frerebeau

## Compute principal components analysis
X <- pca(iris, scale = TRUE)

## Screeplot
screeplot(X)
screeplot(X, cumulative = TRUE)
```

subset

Extract Parts of an Object

Description

Operators acting on objects to extract parts.

Usage

```
## S4 method for signature 'CA,ANY,missing'
x[[i]]

## S4 method for signature 'PCA,ANY,missing'
x[[i]]
```

Arguments

`x` An object from which to extract element(s) or in which to replace element(s).
`i` A [character](#) string specifying elements to extract. Any unambiguous substring can be given (see details).

Details

If `i` is "data", returns a list with the following elements:

`data` A **numeric** matrix of raw data.

`mean` A **numeric** vector giving the variables means (PCA).

`sd` A **numeric** vector giving the variables standard deviations (PCA).

If `i` is "rows", returns a list with the following elements:

`coord` A **numeric** matrix of rows/individuals coordinates.

`cos2` A **numeric** matrix of rows/individuals squared cosine.

`masses` A **numeric** vector giving the rows masses/individual weights.

`sup` A **logical** vector specifying whether a point is a supplementary observation or not.

If `i` is "columns", returns a list with the following elements:

`coord` A **numeric** matrix of columns/variables coordinates.

`cor` A **numeric** matrix of correlation between variables and the dimensions (PCA).

`cos2` A **numeric** matrix of columns/variables squared cosine.

`masses` A **numeric** vector giving the columns masses/variable weights.

`sup` A **logical** vector specifying whether a point is a supplementary observation or not.

If `i` is "eigenvalues", returns a **numeric** vector of eigenvalues.

Value

A **list**.

Examples

```
## Load data
data("iris")

## Compute principal components analysis
X <- pca(iris, scale = TRUE, sup_row = 8:10, sup_col = 1)

## Get results for the individuals
X[["rows"]]
```

summary

Object Summaries

Description

Provides a summary of the results of a multivariate data analysis.

Usage

```
## S4 method for signature 'CA'  
summary(object, ..., margin = 1, active = TRUE, sup = TRUE, rank = 3)
```

```
## S4 method for signature 'PCA'  
summary(object, ..., margin = 1, active = TRUE, sup = TRUE, rank = 3)
```

Arguments

| | |
|--------|--|
| object | A CA , MCA or PCA object. |
| ... | Currently not used. |
| margin | A length-one numeric vector giving the subscript which the data will be summarized: 1 indicates individuals/rows (the default), 2 indicates variables/columns. |
| active | A logical scalar: should the active observations be summarized? |
| sup | A logical scalar: should the supplementary observations be summarized? |
| rank | An integer value specifying the maximal number of components to be kept in the results. |

```

| | |
|------|-------------------------|
| tidy | <i>Tidy Coordinates</i> |
|------|-------------------------|

Description

Tidy Coordinates

Usage

```
tidy(x, ...)
```

```
augment(x, ...)
```

```
## S4 method for signature 'MultivariateAnalysis'
augment(x, ..., margin = 1, axes = c(1, 2), principal = TRUE)
```

```
## S4 method for signature 'MultivariateAnalysis'
tidy(x, ..., margin = 1, principal = TRUE)
```

Arguments

| | |
|-----------|--|
| x | A CA , MCA or PCA object. |
| ... | Currently not used. |
| margin | A length-one numeric vector giving the subscript which the data will be returned: 1 indicates individuals/rows (the default), 2 indicates variables/columns. |
| axes | A length-two numeric vector giving the dimensions for which to compute results. |
| principal | A logical scalar: should principal coordinates be returned? If FALSE, standard coordinates are returned. |

Value

tidy() returns a long [data.frame](#) with the following columns:

label Row/column names of the original data.

component Component.

supplementary Whether an observation is active or supplementary.

coordinate Coordinates.

contribution Contributions to the definition of the components.

cos2 \cos^2 .

augment() returns a wide [data.frame](#) of the row/column coordinates along axes and the following columns:

label Row/column names of the original data.

supplementary Whether an observation is active or supplementary.

mass Weight/mass of each observation.

sum Sum of squared coordinates along axes.

contribution Joint contributions to the definition of axes.

cos2 Joint \cos^2 along axes.

X <- pca(iris, scale = TRUE, sup_row = 5:10)

## Get row principal coordinates
head(get_coordinates(X, margin = 1, principal = TRUE))

## Get row standard coordinates
head(get_coordinates(X, margin = 1, principal = FALSE))

## Tidy principal coordinates
head(tidy(X, margin = 1))
head(tidy(X, margin = 2))

head(augment(X, margin = 1, axes = c(1, 2)))
head(augment(X, margin = 2, axes = c(1, 2)))
```

viz_contributions

Visualize Contributions and cos2

Description

Plots contributions histogram and \cos^2 scatterplot.

Usage

```

viz_contributions(x, ...)

viz_cos2(x, ...)

## S4 method for signature 'MultivariateAnalysis'
viz_contributions(
  x,
  ...,
  margin = 2,
  axes = 1,
  sort = TRUE,
  decreasing = TRUE,
  limit = 10,
  horiz = FALSE,
  col = "grey90",
  border = "grey10"
)

## S4 method for signature 'MultivariateAnalysis'
viz_cos2(
  x,
  ...,
  margin = 2,
  axes = c(1, 2),
  active = TRUE,
  sup = TRUE,
  sort = TRUE,
  decreasing = TRUE,
  limit = 10,
  horiz = FALSE,
  col = "grey90",
  border = "grey10"
)

```

Arguments

| | |
|------------|---|
| x | A CA, MCA or PCA object. |
| ... | Extra parameters to be passed to <code>graphics::barplot()</code> . |
| margin | A length-one numeric vector giving the subscript which the data will be returned: 1 indicates individuals/rows (the default), 2 indicates variables/columns. |
| axes | A numeric vector giving the dimensions to be plotted. |
| sort | A logical scalar: should the data be sorted? |
| decreasing | A logical scalar: should the sort order be decreasing? Only used if sort is TRUE. |
| limit | An integer specifying the number of top elements to be displayed. |

| | |
|-------------|--|
| horiz | A logical scalar: should the bars be drawn horizontally with the first at the bottom? |
| col, border | A character string specifying the bars infilling and border colors. |
| active | A logical scalar: should the active observations be plotted? |
| sup | A logical scalar: should the supplementary observations be plotted? |

Details

The red dashed line indicates the expected average contribution (variables with a contribution larger than this cutoff can be considered as important in contributing to the component).

Value

`viz_contributions()` and `viz_cos2()` are called for their side-effects: they result in a graphic being displayed. Invisibly return `x`.

## Plot cos2
viz_cos2(X)
```

| | |
|-----------------|---|
| viz_individuals | <i>Visualize Individuals Factor Map</i> |
|-----------------|---|

Description

Plots row/individual principal coordinates.

Usage

```
viz_individuals(x, ...)
```

```
viz_rows(x, ...)
```

```
## S4 method for signature 'MultivariateAnalysis'
```

```
viz_rows(  
  x,  
  ...,  
  axes = c(1, 2),  
  active = TRUE,  
  sup = TRUE,  
  labels = FALSE,  
  highlight = NULL,  
  color = NULL,  
  symbol = FALSE,  
  size = c(1, 6),  
  xlim = NULL,  
  ylim = NULL,  
  main = NULL,  
  sub = NULL,  
  panel.first = NULL,  
  panel.last = NULL,  
  legend = list(x = "topleft")  
)
```

```
## S4 method for signature 'BootstrapCA'
```

```
viz_rows(x, ..., axes = c(1, 2), color = FALSE, symbol = FALSE)
```

```
## S4 method for signature 'PCA'
```

```
viz_individuals(  
  x,  
  ...,  
  axes = c(1, 2),  
  active = TRUE,  
  sup = TRUE,  
  labels = FALSE,  
  highlight = NULL,  
  color = NULL,
```

```

symbol = FALSE,
size = c(1, 6),
xlim = NULL,
ylim = NULL,
main = NULL,
sub = NULL,
panel.first = NULL,
panel.last = NULL,
legend = list(x = "topleft")
)

```

Arguments

| | |
|-------------|--|
| x | A CA, MCA or PCA object. |
| ... | Further graphical parameters (see details). |
| axes | A length-two numeric vector giving the dimensions to be plotted. |
| active | A logical scalar: should the active observations be plotted? |
| sup | A logical scalar: should the supplementary observations be plotted? |
| labels | A logical scalar: should labels be drawn? Labeling a large number of points can be computationally expensive and make the graph difficult to read. A selection of points to label can be provided using a list of two named elements, how (a string specifying how to select the labels to be drawn) and n (an integer specifying the number of labels to be drawn). See examples below. |
| highlight | A vector specifying the information to be highlighted. If NULL (the default), no highlighting is applied. If a single character string is passed, it must be the name of a categorical variable, or one of "observation", "mass", "sum", "contribution" or "cos2" (see augment()). |
| color | The colors for lines and points (will be mapped to highlight). Ignored if set to FALSE. |
| symbol | A vector of plotting characters or symbols. |
| size | A length-two numeric vector giving range of possible sizes (greater than 0; will be mapped to highlight). Ignored if set to FALSE. |
| xlim | A length-two numeric vector giving the x limits of the plot. The default value, NULL, indicates that the range of the finite values to be plotted should be used. |
| ylim | A length-two numeric vector giving the y limits of the plot. The default value, NULL, indicates that the range of the finite values to be plotted should be used. |
| main | A character string giving a main title for the plot. |
| sub | A character string giving a subtitle for the plot. |
| panel.first | An expression to be evaluated after the plot axes are set up but before any plotting takes place. This can be useful for drawing background grids. |
| panel.last | An expression to be evaluated after plotting has taken place but before the axes, title and box are added. |
| legend | A list of additional arguments to be passed to graphics::legend() ; names of the list are used as argument names. If NULL, no legend is displayed. |

Value

`viz_*()` is called for its side-effects: it results in a graphic being displayed. Invisibly returns `x`.

Aesthetics

```
## S4 method for signature 'MultivariateAnalysis'
viz_confidence(x, ..., margin = 1, axes = c(1, 2), group = NULL, level = 0.95)

## S4 method for signature 'BootstrapCA'
viz_confidence(x, ..., margin = 1, axes = c(1, 2), level = 0.95)

## S4 method for signature 'MultivariateAnalysis'
viz_hull(x, ..., margin = 1, axes = c(1, 2), group = NULL)

## S4 method for signature 'BootstrapCA'
viz_hull(x, ..., margin = 1, axes = c(1, 2))
```

Arguments

| | |
|--------|--|
| x | An object from which to wrap observations (a CA , MCA or PCA object). |
| ... | Further graphical parameters to be passed to graphics::polygon() . |
| margin | A length-one numeric vector giving the subscript which the data will be returned: 1 indicates individuals/rows (the default), 2 indicates variables/columns. |
| axes | A length-two numeric vector giving the dimensions for which to compute results. |
| group | A vector specifying the group an observation belongs to, or a single character string giving the name of a categorical variable. |
| level | A numeric vector specifying the confidence/tolerance level. |

Value

`viz_*()` is called for its side-effects: it results in a graphic being displayed. Invisibly returns x.

Author(s)

N. Frerebeau

Other plot methods: [biplot\(\)](#), [screplot\(\)](#), [viz_contributions\(\)](#), [viz_individuals\(\)](#), [viz_variables\(\)](#), [wrap](#)

Examples

```
## Load data
data("iris")

## Compute principal components analysis
X <- pca(iris, scale = TRUE, sup_quali = "Species")

## Plot with convex hulls
col <- c("#004488", "#DDAA33", "#BB5566")
viz_rows(X, highlight = "Species", color = col)
```

```

viz_hull(X, group = "Species", border = col)

## Plot with tolerance ellipses
col <- c("#004488", "#DDAA33", "#BB5566")
viz_rows(X, highlight = "Species", color = col)
viz_tolerance(X, group = "Species", border = col)

```

wrap

Wrap Observations

Description

- `wrap_hull()` computes convex hull of a set of observations.
- `wrap_confidence()` computes a confidence ellipse.
- `wrap_tolerance()` computes a tolerance ellipse.

Usage

```

wrap_hull(x, ...)

wrap_confidence(x, ...)

wrap_tolerance(x, ...)

## S4 method for signature 'MultivariateAnalysis'
wrap_confidence(x, margin = 1, axes = c(1, 2), group = NULL, level = 0.95)

## S4 method for signature 'MultivariateAnalysis'
wrap_tolerance(x, margin = 1, axes = c(1, 2), group = NULL, level = 0.95)

## S4 method for signature 'MultivariateAnalysis'
wrap_hull(x, margin = 1, axes = c(1, 2), group = NULL)

```

Arguments

| | |
|---------------------|--|
| <code>x</code> | An object from which to wrap observations (a CA , MCA or PCA object). |
| <code>...</code> | Currently not used. |
| <code>margin</code> | A length-one numeric vector giving the subscript which the data will be returned: 1 indicates individuals/rows (the default), 2 indicates variables/columns. |
| <code>axes</code> | A length-two numeric vector giving the dimensions for which to compute results. |
| <code>group</code> | A vector specifying the group an observation belongs to, or a single character string giving the name of a categorical variable. |
| <code>level</code> | A numeric vector specifying the confidence/tolerance level. |

Value

wrap_*() returns a [data.frame](#) of envelope x and y coordinates.

An extra column named group is added specifying the group an observation belongs to.
